## **Effects of Nest and Nest Site Characteristics on Humboldt Penguins' Breeding Success at Punta San Juan, Peru**

Jul 26 2020 Populations of Humboldt penguins (*Spheniscus humboldti*) in Peru began declining significantly in the 19th century because of industrial guano mining and a later increase in fishing. Guano mining changed the features of the penguins' breeding habitat by eliminating the substrate where this species excavated their burrows. We analyzed the effects of nest and nest site characteristics and monitoring methodologies on Humboldt penguins' breeding performance at Punta San Juan, Peru. We used a binomial generalized linear mixed model with random intercept to tests for differences in the probability of successfully raising at least one fledgling and also tested for differences in the number of fledglings produced among nests with different characteristics. We identified nests (including artificial nests) and classified them by nest cover (covered or uncovered), nest site habitat (cliff tops and beaches or caves) and nest substrate (guano or other substrate). We also assessed the impact of invasive and noninvasive nest monitoring methodologies on breeding performance. We included year and breeding season as random effects to account for environmental oscillation between and within years. Our results showed that the combination of guano substrate with noninvasive nest monitoring and nest cover were best correlated with penguin breeding success (increased probability of success and number of successful fledglings). The mean number of fledglings produced changed significantly between years and breeding seasons. In a separate analysis, breeding success of artificial nests was similar to natural covered or uncovered nests. Artificial nests in guano substrates were more successful than artificial nests in other substrates. Breeding success between habitats was similar. Our results show that nest and nest site characteristics affect Humboldt penguins' breeding performance. Management decisions regarding penguins breeding habitat can affect the conservation of

Humboldt penguins. An experiment is required to disentangle the effects of monitoring methodology and substrate on Humboldt's penguins' breeding performance, but as cautionary measures we recommend careful nest monitoring and avoiding guano extraction from penguins' breeding sites.

Breeding Success and Life's Issues Apr 27 2023 Breeding Success and Life's Issues focuses on the need to be a successful person and having the right mind-set to be able to achieve that. For success to occur, one has to be prepared for it. It doesn't happen in one day, it doesn't happen in one week. But what matters most is preparation. The book serves as a piece to advise people who are also going through real life issues and with the few examples illustrating that, one can certainly derive positivity and confidence just from reading the book. The thing about those who breed success, is if you leave them stranded on an island, instead of them building a canoe to paddle across in no time, they would rather save their energy by becoming conversant with their environment by thinking SURVIVAL first, thus charging up their instincts as the sea roughens. They will think of shelter, food, and clothing before escape.

Red-winged Blackbirds Jun 17 2022 Drawing on detailed data from their sixteen-year study of red-winged blackbirds in the marshes of Washington's Columbia National Wildlife Refuge, Beletsky and Orians analyze the information redwings use to make breeding-season decisions and the consequences these decisions have for lifetime reproductive success. Because male and female redwings make different, and often independent, decisions—males focus on territory acquisition and maintenance, while females must choose when and where to nest and how much energy to invest in reproduction—the authors have taken the novel approach of studying the sexes separately. Using analyses of observational data combined with field experiments and game-theoretical models, the authors provide new insights into the complex patterns of reproductive decision-making and breeding behavior in redwings. This book will be of interest to all who study social animals, including behavioral ecologists, evolutionary biologists, and ornithologists.

Breeding Success Manifesting The Life You Desire Dec 23 2022 Breeding Success reveals life-changing knowledge, and teaches you how to apply this knowledge in your everyday life. No matter who you are, no matter where you are, no matter what your current circumstances, Breeding Success is going to change your entire life! This book teaches that life is supposed to feel good and that our overall success is what is natural. It teaches that no matter how good your life is now, it can

always get better, and that the choice and the power to improve your life experience is within your personal control. And it offers practical philosophical tools that—when put into consistent use—will enable you to allow yourself to experience more of the success and happiness that is your natural birthright. For those people who are ready to improve their lives in all areas of life this book is the remedy. The words and thoughts of this book's pages are the advice you have been looking for. It teaches you to actively participate in the creative process of making your goals happen in an exhilarating way. This book provides you with all the tools necessary to do that; what remains is for you to apply them.

Questions: (How) do grazing sheep affect the breeding success of *Lullula arborea* as Annex I species of the Birds Directive? Location: Grenspark de Zoom-Kalmthoutse Heide, Northern Belgium

Methods: Plots with breeding woodlarks were studied over the breeding season. 4 plots were grazed and 2 were not. Nest success was assessed and failures were recorded. Nest success, timing of failure and breeding bout duration were analyzed in relation to grazing sheep. Results: Over 2 breeding seasons it is clearly indicated that grazing sheep have a negative impact on nest success of *L. arborea*. Failure was 4 times higher in plots with sheep present than in plots where sheep were absent. Under sheep absence only 20% of nest failures happened by daylight whereas sheep presence gives rise to an increase of daytime failures to 90%. The mechanisms behind this shift are not clear. Our results suggest that nest failure is not directly related to the vicinity of sheep. Nest attendance is not an issue since it does not decrease under sheep grazing. Conclusions: Grazing sheep affects nest success of *L. arborea* semi-directly. Although exact mechanisms are not yet known our results suggest that grazing sheep alter predation regimes. Grazing regimes or timing should be adapted in order to properly protect this woodlark population.
